

Group Contribution Report

Project 1 – Campus Resource Reservation System

Team Member	Component(s)	Specific Tasks Completed	Testing/Debugging	GitHub Contribution
Group Member 1 Faith Paredes	Resource Management + Repository Setup	Created the GitHub repository and initial project structure, uploaded resources.txt and reservations.txt, organized source/header files into include/ and src/ folders, wrote/updated README.txt, started ComplexityAnalysis.md, uploaded GroupContributionReport.docx, created .gitignore, created Resource.cpp, Resource.h, Reservation.h, RreservationManager.h, Main.cpp, Reservation.cpp, ReservationManager.cpp, merged branch into main.	Compiled the full project, after each round of fixes to Resource.cpp, ReservationManager.cpp, and Main.cpp, I identified and corrected errors that affected resolution. Such as missing semicolons and incorrect cases used. Also ran tests covering the full menu flow.	13 commits on main, including e1969b9 (initial commit), 0950681, 998274c, 50644e1, ec09dd0, 2401817, 996ea9a, fdd0203, ece3519, d4b727a, f9cc1d9, 1630afd, fc1fc49, d71e99e, ece3519, 901c7cb, 783e523, 63fd3aa, b121dab, 1767326
Group Member 2 Isiah Ndanzi a	Waiting List + Cancellation	Created files waitinglist.cpp, Cancellationhistory.cpp, Reservationrecord.h, waitinglist.h, cancellationhistory.h	Went through added files to verify there were no syntax errors and everything was done correctly	Commits d6da11a , d6da11a, 00a1f7a, 4a80615, 4a80615,
Group Member 3 Caleb Djan	Reservation Management + Linked List	Finalized and optimized the Reservation Management subsystem, co-developed the custom linked list by implementing negative input validation, duplicate ID prevention, and strict error handling. Added Big-O and function-level documentation.	Conducted system integration testing in PuTTY on the UNT CSCE server. Deubugged and fixed vulnerabilities in the reservationManager and reservation files and inputted validation requirements.	Commits 380e27d 657bo55 Commits to ReservationManager.cpp, reservation.cpp, edge-case handling.

Group Member 1 – Faith Paredes

I set up the GitHub repository for our team and made the initial commit (e1969b9). I uploaded the provided data files, resources.txt (0950681) and reservations.txt (998274c), and later reorganized both into a data/ folder to match our required project structure. I also renamed and updated the project README (50644e1, ab55117), uploaded and organized the skeleton source and header files into include/ and src/ folders (e6fa237, ec09dd0, 0bcf1ca, 674612c, 2401817),

and began the complexity analysis document (996ea9a), and created the team's contribution log (fdd0203). I uploaded and edited Resource.cpp, Resource.h, Reservation.h, RreservationManager.h, Main.cpp, Reservation.cpp, ReservationManager.cpp (ece3519, d4b727a, f9cc1d9, 1630afd, fc1fc49, f0bec83, ec09dd0, 674612c, 0bf1ca). I created and edited the .gitignore file (d71e99e). Then, I focused on getting the codebase to compile once the team's individual pieces were merged. Across several rounds, I found and fixed build breaking errors (901c7cb, 783e523, 63fd3aa, b121dab, 1767326). After editing all my created files, I compiled the code and made minor edits by merging a branch into main (ece3519).

Group Member 2– Isiah Ndanzia

I developed the Waiting List and Cancellation subsystems. I created the files waitingList.cpp, Cancellationhistory.cpp, waitingList.h, and cancellationhistory.h to manage the respective queue and stack data structures. Once the logic was implemented, I reviewed my added files to verify there were no syntax errors and ensured the structures functioned correctly.

Group Member 3 – Caleb Djan

I finalized and optimized the reservation management subsystem by implementing strict error handling and input validation. I specifically refactored ReservationManager.cpp to prevent duplicate reservation IDs from being inserted into the linked list and added logic to reject malformed or negative inputs during file parsing. I also authored the documentation and time complexity for all linked list inputs. Finally, I conducted system integration by testing PuTTY to debug edge-case removals, verify memory management, and ensure all validation requirements are executed correctly.
